

## 2 Joule

Joule is an AI solution embedded into the flow of work across SAP and non-SAP systems. Its conversational UI provides access to contextual insights and task guidance directly where people do their jobs. Joule presents the relevant, consolidated information about a business process or transaction so you see the full situational picture in one place. It ingests and references enterprise documents from connected repositories, and interoperates with other generative assistants to bring relevant information and automation into a single, consistent experience on desktop and mobile.

Underpinning these capabilities are extensibility and governance mechanisms that let IT and developers build, configure, and operate custom agents and integrations while preserving system mappings, access controls, and data handling policies. Conversation history, analytics, feedback, and data management are captured natively to provide auditability, measure adoption and impact, and support controlled scaling without compromising compliance or security.

As a result, Joule accelerates time-to-value for AI initiatives by reducing operational friction and improving cross-team collaboration so core processes run more effectively; decision makers and administrators gain measurable insight into usage and outcomes, enabling iterative investment in high-value scenarios with confidence.
