SAP Fiori For SAP S/4HANA

The Material Management (MM) module in SAP S/4HANA uses a simplified data model compared to older versions. While some classic tables remain for compatibility, new tables and structures are central to S/4HANA's architecture. Here's a breakdown of commonly used tables, keeping in mind the S/4HANA context:

1. Material Master Data:

- **MARA:** General Material Data (basic information like material type, material group, etc.)
- **MAKT:** Material Descriptions (descriptions in different languages)
- **MARM:** Units of Measure for Material (quantity units, dimensions, etc.)
- **MBEW:** Material Valuation (accounting and valuation data)
- **MARD:** Storage Location Data for Material (stock quantities per storage location)

2. Purchasing:

- **EKKO:** Purchasing Document Header (general information about the purchase order)
- **EKPO:** Purchasing Document Item (details of each item in the order)
- **EKET:** Scheduling Agreements (delivery schedule dates)
- **EINA:** Purchasing Info Record - General Data (general information about the vendor-material relationship)
- **EINE:** Purchasing Info Record - Purchasing Organization Data (data specific to the purchasing organization)
- **EBAN:** Purchase Requisition (internal request for procurement)

3. Inventory Management (Key Change: MATDOC):

- **MATDOC:** This is the *most important* table for inventory management in S/4HANA. It replaces the classic combination of MKPF (header) and MSEG (item) tables. MATDOC stores all material document information in a single table, significantly improving performance. This is a crucial change in S/4HANA.
 - MKPF and MSEG still exist, primarily for compatibility with older reports and programs. However, for new development and reporting, MATDOC should be used.
- **MBLNR:** Material Document Number (still relevant for referencing documents).
- **BWART:** Movement Type (identifies the type of stock movement).
- **LGORT:** Storage Location.
- **MATNR:** Material Number.

4. Valuation:

- **MBEW:** Material Valuation (accounting and valuation data, standard price, moving average price, etc.)

- **CKMI:** Price History (history of price changes)

5. Material Requirements Planning (MRP):

- **MDKP:** MRP Header Data (general information about the MRP run)
- **MDTB:** Planning Table (results of the requirements calculation)

6. General and Organizational Data:

- **T001W:** Plants
- **T024E:** Purchasing Organizations
- **T001L:** Storage Locations

7. Pricing Conditions (Important Change: PRCD_ELEMENTS):

- **PRCD_ELEMENTS:** This is the central pricing table in S/4HANA. It stores pricing element details (discounts, surcharges, taxes) for various business processes (sales, purchasing, billing). This table improves performance and flexibility compared to older condition tables.
- KONV, KONP, and condition tables (A001-AXXX) still exist for compatibility but are less central in S/4HANA.

Key S/4HANA Considerations:

- **Simplified Data Model:** S/4HANA aims to reduce data redundancy. MATDOC and PRCD_ELEMENTS are prime examples of this simplification.
- **Compatibility Views:** SAP provides compatibility views to map old table structures to new ones. This allows older programs to continue working.
- **CDS Views:** Core Data Services (CDS) views are heavily used for data access and reporting. They provide a virtual data model on top of the physical tables, simplifying data consumption. This is the preferred way to access data in S/4HANA.
- **Business Partner (BP):** While not a table itself, the Business Partner is a key concept in S/4HANA. It replaces vendor master (LFA1, LFB1, etc.) and customer master data, using tables like BUT000.

In summary: While some classic MM tables remain, S/4HANA introduces key changes with tables like MATDOC and PRCD_ELEMENTS, along with the Business Partner concept and CDS views. When working in an S/4HANA system, focus on understanding these new structures and using CDS views for data access whenever possible. This will ensure better performance and alignment with S/4HANA's architecture.
