Materials Management

Materials Management is a comprehensive solution for mapping logistical processes. The tools in **Materials Management** such as material requirements planning (MRP), **Purchasing**, **Goods Receipt**, **Inventory Management**, and **Invoice Verification** supports you during the entire procurement process and in inventory management. If you activate the business function **Material Segmentation Across Logistics**, you can procure and manage materials at the level of segmentation during the entire procurement process. Reports and screens have been adjusted and master data has been enhanced so that you can manage materials segmentation (such as various qualities and country of origin).

Segmentation: Purchasing Documents

Use

Segmentation allows you to logically segment materials based on certain attributes, for example, **Quality** or **Customer segment**. When you use materials with segmentation, you can also process quantities and conditions in purchasing documents for individual stock segments.

For more information about processing of purchasing documents in the standard ERP system, see [Purchasing \(MM-PUR\)](#).

Prerequisites

- You have activated the business function **Material Segmentation Across Logistics** (LOG_SEGMENTATION)
- You have created the characteristics for segmentation using transaction CT04
- You have defined segmentation structures in Customizing for ► **Logistics – General** ► **Segmentation** ► **Define Segmentation Structures** ►
- You have defined segmentation strategies in Customizing for ► **Logistics – General** ► **Segmentation** ► **Define Segmentation Strategies** ►
- You have created materials and assigned a segmentation strategy in the material master (transaction MM01)

Process

To procure materials with segmentation, the system allows you to maintain data in purchasing documents for the corresponding stock segment. You can manually enter the stock segment or the system copies the value from various sources such as other purchasing documents, or determine during requirement planning (MRP).

The system does not allow you to enter or maintain stock segment for a material if one of the following condition is true:

- Material is not relevant for segmentation
- Plant to which the material belongs is not relevant for segmentation
- Material is relevant for segmentation but you did not assign or fix the segmentation strategy and the segmentation structure
- Scope is **Only Requirement Segments Maintained** in the segmentation strategy

For more information about how segmentation is handled in individual purchasing documents, see the following:

More Information

[Segmentation Structure](#)

[Segmentation Strategy](#)

Purchase Requisition

Definition

A purchase requisition is a request or instruction to **Purchasing** to procure a certain quantity of a material or a service so that it is available at a certain point in time.

Use

The system allows you to maintain instructions to procure a certain quantity of different stock segments of a material.

When you manually create a purchase requisition, the system allows you to enter a valid stock segment for a material. During MRP if the required quantity of stock is not available, the system proposes a purchase requisition and determines stock segment for the material. The system determines the stock segment based on the segmentation strategy you assigned for the material of the plant.

When you create purchase orders with reference to a purchase requisition, the system allows you to change the stock segment and ordered quantities for a material that are copied from the reference document.

The system determines the requirement segment for a stock transport requisition based on the stock segment and the [segmentation strategy](#) you assigned for the material in the material master.

Structure

On the **Item Overview** screen, you can specify the following information for different stock segments of a material:

- Purchase requisition quantities
- Delivery date

The system also displays the schedule line number and ordered quantities.

More Information

[Segmentation: Purchasing Documents](#)

Purchasing Info Record

Definition

Stores master data such as vendor and material, for a purchasing organization or a plant

Use

The system allows you to maintain data for individual stock segment for a combination of vendor and material.

When you create a purchase order with reference to documents, for example purchasing info record, the system copies the segment values from the reference document.

You can maintain purchase info record (under delivery and over delivery tolerance, minimum and maximum purchase order quantities) for individual segments of a material in the material master. Assume that you did not maintain these values for a material in the material master and try creating a purchase order for the same material. In such case, the system copies the purchase info record details for the individual segment of a material from the purchasing info record document that you already created for the material.

Structure

You can maintain the following information for different stock segments of a material while creating the purchasing info record:

- Under delivery tolerance
- Over deliver tolerance
- Minimum purchase order
- Maximum purchase order quantities
- Rounding profile for each segment

Contracts

Definition

A contract is a type of outline purchase agreement against which release orders (releases) can be issued for agreed materials or services as and when required during a certain overall time-frame. You can create quality based contracts (MK) or value based contracts (WK).

Use

The system allows you to create and process contracts for different stock segments of a material.

Structure

The contract consists of items defining the individual materials, material groups with prices and target quantities for different stock segments of a material. For example, you can create contract with vendor-specific quantities or order value of the same material for different stock segment.

If you maintain values for different stock segments in the material master under **Additional Data**, the system displays the valid weights and volumes in the detail view for the different stock segments of the material.

More Information

[Weights and Volumes in Purchasing Documents](#)

Purchase Orders

Definition

Purchase order is a formal request or instruction from a purchasing organization to a vendor or a plant to supply or provide a certain quantity of goods or services at or by a certain point in time.

Use

Segmentation at item level allows you to order materials with different attributes, for example, quality and/or customer channel. You can maintain information such as delivery tolerances, purchase quantities, and so on, for different segmentation value of a material. The system copies such information from a reference document, such as purchasing info record, purchase requisition, and contracts to a purchase order. The system determines the valid stock segment for a material based on the segmentation structure and the segmentation strategy you assigned for the material.

For a material in purchase order and stock transport order, the system allows you to maintain only stock segment and determines the requirement segment based on the segmentation strategy.

Structure

The system allows you to maintain stock segments for a material in the **Item Detail** screen only if you maintain the plant is relevant for segmentation. You can also maintain purchase order quantities, delivery date, and so on, for the different stock segments of a material

i Note

For transfer of stock between plants, the system determines the requirement segment of the issuing plant using the segmentation strategy and the stock segment of the receiving plant. For more information about stock transfer between plants, see [Stock Transport Order for Materials with Segmentation](#)

Purchase Order Confirmations

With SAP ERP 6 Enhancement Package 7 Support Package Stack 10 release onwards, you can process and view order confirmations for the individual segmentation values in the **Confirmation** tab of purchase order for materials that are relevant for

segmentation. When you create an order confirmation manually, you enter the quantities and the corresponding segmentation values and save the document. In addition, when you create an inbound delivery with reference to a purchase order, you can view the inbound delivery item details such as stock segment and quantity in the **Confirmation** tab.

Purchase Order History

In the standard ERP, on the purchase order history tab, the system displays the history of goods receipts and invoices relating to the purchase order. In addition, with SAP ERP 6 Enhancement Package 7 Support Package Stack 10 release onwards, you also can view the segmentation details for segmentation relevant materials in the history of goods receipts and invoices in this **History** tab.

More Information

[Weights and Volumes in Purchasing Documents](#)

Changing Stock Segment Using Fast Change

Prerequisites

You have created materials and assigned the segmentation strategy in the material master.

Context

Fast change enables you to change several items of a document simultaneously. In addition, you can change the stock segment for several items of a purchase order using the fast change option. For example, you notice that you must procure only materials of segment X and not of segment Y. You can use fast change to change segment X to segment Y. You can change the stock segment for all the selected items or for all the items in purchase order.

For more information about fast change in the standard SAP ERP system, see [Purchase Order – Single-Screen Transaction \(ME21N, ME22N, and ME\)](#).

Procedure

1. Create or open an existing purchase order.
2. Enter a material and all the necessary details including the relevant stock segment.
3. Choose one or more line items for which you want to change stock segment.
4. In the **Change Layout** dialog box, choose **Stock Segment** from the list of **Hidden fields**. If you have already selected the **Stock Segment** column, this dialog box does not appear.
5. In the **Fast Change** dialog box, choose a different stock segment.
6. Choose the icon for **Fast Change**.

Results

Stock segment is changed for all the selected line items or for all the items in the document based on the selection in step 3. If any of the material is not relevant for segmentation, stock segment is not assigned to the material as a result of fast change execution.

Example

You have the following items in purchase order:

- Shirt_T with stock segment X
- Shirt_T1 with stock segment Y
- Shirt_T2 with no stock segment

For all the three items you want to change stock segment to Z. The result of fast change is as follows:

- Shirt_T with stock segment Z
- Shirt_T1 with stock segment Z
- Shirt_T2 with no stock segment

In addition, the system validates the newly assigned stock segment. The system displays a message if the stock segment assigned for Shirt_T1 as a result of fast change is not valid. You must choose only that line item and choose a valid stock segment for that material.

Return Purchase Order

Use

In a business scenario, the company will have to send the goods back to the vendor if the stock is of poor quality or if there is excess stock. The return to stock is done with the help of a document called [Return Purchase Order](#).

Process

The goods to be returned are marked as Return Items in the purchase order.

If a plant that is relevant for segmentation returns the stock to vendor, the system determines the stock segment for the supplying plant based on the settings you maintained in Customizing for [Purchase Orders](#) under [Logistics - General](#) [Segmentation](#) [Determine Segment Value for Automatic Determination](#). The requirement segment is not applicable.

If a plant that is not relevant for segmentation returns the stock to vendor, segmentation is not applicable and the system does not determine the stock segment or the requirement segment.

Goods Issue

Definition

The system allows you to post a material withdrawal or a material issue. A goods issue leads to a reduction in warehouse stock.

Structure

When you create goods issue for a material, you can specify quantities that you like to withdraw for each stock segment. Since negative stock is not permitted, you cannot enter a goods issue for stock segments that exceed the available stock. If the material is managed in batches, the system assigns a batch number to the material when you post a goods receipt. The batch number the system determines is based on the batch indicator you set in the material master. For more information about batch management, see [Batch Management for Material Segmentation](#).

Goods Receipt

Definition

With the goods receipt (GR) you post the physical inward movement of goods from an external vendor or from production and then complete a goods movement, which leads to an increase in the warehouse stock.

Structure

The system allows you to process goods receipt for different segments of the material. You can maintain the quantity delivered for each stock segment on the [Item Detail](#) screen. In addition, you can maintain the stock segment for materials both in the [Item Overview](#) screen and in the [Batch](#) tab of the [Item Detail](#) screen. Before posting the goods, you can change stock segment for a material only by using the transaction [MIGO](#).

If the receiving plant is not relevant for segmentation, then stock segment for a material is invisible in the following scenarios:

- For goods movement with reference to documents, for example [Purchase Order](#)
- For transfer posting
- For goods movement with reference to [others](#)

You must use batch management for materials with stock segment. The system assigns a batch number to the material when you post a goods receipt. The batch number the system determines is based on the batch indicators you set in the material master. For more information about batch management, see [Batch Management for Material Segmentation](#).

Inbound Delivery

Definition

Inbound delivery is enhanced to handle materials with segmentation. The system copies the stock segment from the purchase order.

You must use batch management for materials with stock segment. Batch determination happens in inbound delivery and the batch number is proposed. After you post the goods receipt, the system creates a new batch or post the quantities to an existing batch. For more information about batch management, see [Batch Management for Material Segmentation](#).

More Information

[Weights and Volumes in Purchasing Documents](#)

Batch Determination for Inbound Deliveries

Use

You can enable the system to check if the batch entered in the inbound delivery document already exists in the system. To do this, you can use the [No Batch Check](#) checkbox in the Customizing activity [Define Item Categories for Deliveries](#) under [Logistics Execution > Shipping > Deliveries](#). A batch split describes the situation where more than one batch is used to cover a particular delivery item. The batch split function in the delivery includes a batch selection screen and an availability check.

Features

During the batch determination process, for a material that is relevant for segmentation the system proposes the new batch number according to the segmentation value entered in the document.

- If you select this checkbox, the system does not update the new batch number in the document and does not perform a batch split, although the batch is relevant for segmentation. However, if the system determines an existing batch number, the system updates the batch number in the document and performs a batch split.
- If you do not select this checkbox, the system determines a new batch number or an existing batch number and updates the determined batch number in the document and performs a batch split.

Invoice Verification

You can use the logistics invoice verification to check incoming invoices for their functional, price, and mathematical correctness. You can run this verification for materials with segmentation at the segment level. The segment values are copied from purchase order and you cannot change them.

Physical Inventory

The system allows you to carry out a physical inventory of your company's warehouse stocks for balance sheet purposes. For materials with segmentation, you can maintain the inventory for different stock segments. Stock segment is attached to a batch and thus batch management is mandatory in [Physical Inventory](#).

When you enter the materials for which you want to carry out physical inventory, the system determines the stock segment based on the batch number.

You can filter the batches based on the stock segments.

Reservations

Definition

A request to the warehouse or plant to keep a material ready for issue at a future date for a certain purpose

Use

Reservations are enhanced to handle materials with segmentation. If the material is relevant for batch management, the system determines the stock segment based on the material, batch, and plant. You cannot change the stock segment. For more information, see [Batch Management for Material Segmentation](#)

Quotation

Definition

A quotation is an offer by a vendor to a purchasing organization regarding the supply of materials or performance of services subject to specified conditions.

i Note

The system only validates the stock segment you enter for a material in Quotation when you enter a plant and a material that is relevant for segmentation. If you do not enter a plant but enter an invalid stock segment for a material that is relevant for segmentation, the system allows you to save the document.

Structure

A quotation is legally binding on the vendor for a certain period. The quotation is the vendor's response to a request for quotation issued by a purchasing organization.

A quotation consists of items in which the total quantity and delivery date of an offered material or service are specified. For materials relevant for segmentation, the system allows you to maintain quantity and delivery data for the different stock segments of the material.

Request for Quotation

Definition

A request for quotation (RFQ) is an invitation extended to a vendor by a purchasing organization to submit a quotation (bid) for the supply of materials or performance of services. The system allows you to create request for quotation to supply different stock segments of a material.

i Note

The system only validates the stock segment you enter for a material in RFQ when you enter a plant and a material that is relevant for segmentation. If you do not enter a plant but enter an invalid stock segment for a material that is relevant for segmentation, the system allows you to save the document.

Structure

An RFQ consists of the RFQ header and the items.

- RFQ header

Contains general information on the RFQ, such as the vendor's address.

- Items

Contain the total quantities and delivery dates for the materials or services specified in the RFQ. You can maintain quantities and delivery dates for individual stock segments of a material.

An item of a quotation may contain a delivery schedule made up of a number of schedule lines in which the total quantity is broken down into smaller quantities to be delivered on the specified dates over a certain period.

Scheduling agreement

Definition

A form of outline purchase agreement under which materials are procured on predetermined dates within a certain time period.

Structure

A scheduling agreement consists of a number of items, for each of which a procurement type is defined. The following procurement types exist:

- Standard
- Subcontracting
- Consignment
- Stock transfer

Delivery of the total quantity of material specified in a scheduling agreement item is spread over a certain period in a delivery schedule, consisting of lines indicating the individual quantities with their corresponding planned delivery dates. For materials relevant for segmentation, you can maintain the quantities and the planned delivery dates for individual stock segments of the material.

When you maintain delivery schedule for the scheduling agreement of materials relevant for segmentation, the segmentation details are adopted from the scheduling agreement and you cannot edit the stock segment.

Stock Transport Order for Materials with Segmentation

Use

You can carry out stock transfers between storage locations within a plant, between different plants, and between company codes. You cannot transfer materials with segmentation between plants with different segmentation strategies. You can only transfer materials with segmentation between plants with the same segmentation strategies. You can also transfer materials with segmentation between plants if one of the plants is not relevant for segmentation. If both the receiving plant and the supplying plant is assigned with the same segmentation strategy, you must define the mapping between the stock segment and the requirement segment of the plants involved.

Features

- If both the receiving plant and the supplying plant are relevant for segmentation, the stock segment in the stock transport order is mapped to the corresponding requirement segment of the supplying plant. This mapping is based on the Customizing for [Define Segmentation Strategies](#) under [Logistics – General > Segmentation](#).
- If the supplying plant is relevant for segmentation and the receiving plant is not relevant for segmentation, the stock transport order does not have a stock segment. The system determines the requirement segment for the supplying plant in one of the following ways:
 - Priority 1: Based on the segment value assignment you define in the Customizing for [Define Segment Value for Automatic Determination](#) under [Logistics – General > Segmentation](#).
 - Priority 2: If you do not define the segment value assignment in the Customizing activity [Define Segment Value for Automatic Determination](#), the system uses the default stock segment maintained in the Customizing for [Define Segmentation Structures](#) under [Logistics – General > Segmentation](#).
 - Priority 3: If the above options fail, the system determines the requirement based on the logic you define in the BAdI [BADI_SEG_SPEC_PROD_MM](#) (under [Logistics - General > Segmentation > Enhancements for Segmentation > BAdI: Segment Values in Purchase Order](#)).
- If the supplying plant is not relevant for segmentation and the receiving plant is relevant for segmentation, the stock transport order has the stock segment value and the material is posted to the supplying plant without any segmentation

Example: Stock Transport Order

You have specified a material in the following plants:

Plant	Segmentation Enabled	Company Code
DC1	Yes	001
DC2	No	001
DC3	Yes	002

Scope is maintained as Both Requirement and Stock Segment Maintained in the segmentation strategy

Scenario 1: DC3 supplies to DC1. Both the supplying plant and the receiving plant are relevant for segmentation. You defined the stock segment in the stock transport order. The system determines the requirement segment in one of the following ways:

- Priority 1: Based on the segment value assignment you define in Customizing for [Stock Transfer](#) under [Logistics – General > Segmentation > Define Segmentation Strategies](#).
- Priority 2: If you do not define the segment value assignment in Customizing activity [Define Segmentation Strategies](#), the system determines the requirement segment based on the logic you define in the BAdI `BADI_SEG_SPEC_PROD_MM` (under [Logistics - General > Segmentation > Enhancements for Segmentation](#)).
- Priority 3: If you do not specify the logic in the BAdI, the system determines the requirement segment based on the default stock segment you define in Customizing for [Define Segmentation Structures](#) under [Logistics – General > Segmentation](#).
- Priority 4: If BLANK is not a valid segmentation value and no segmentation value is found, the system displays an error message.

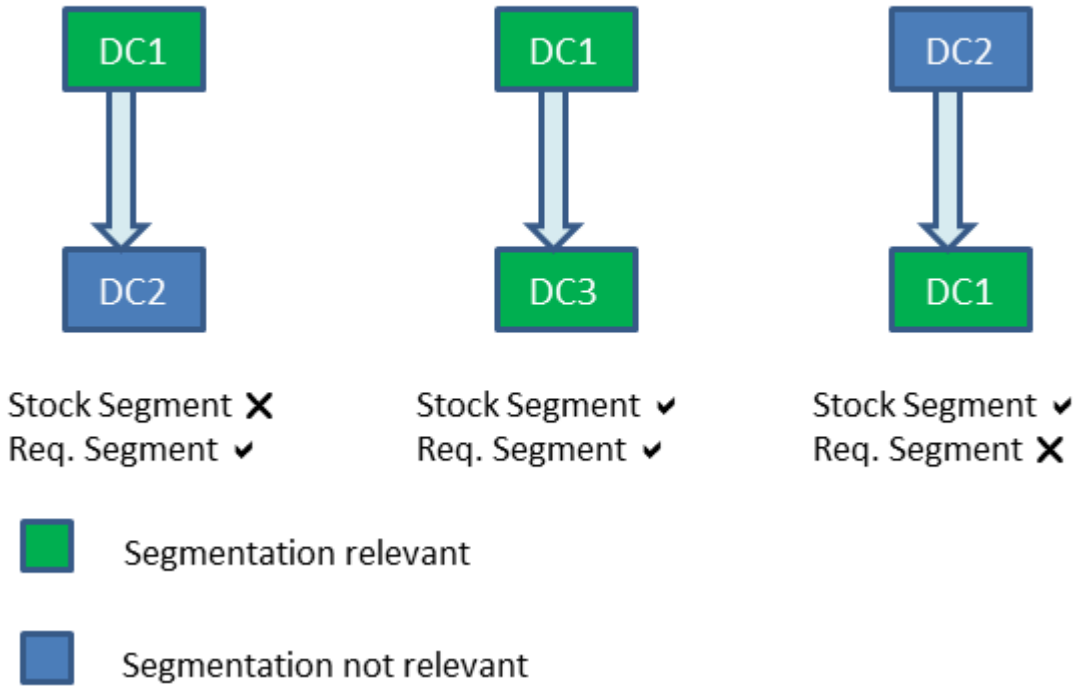

Scenario 2: DC3 supplies to DC2. The receiving plant is not relevant for segmentation. You did not define the stock segment in the stock transport order. The system determines the requirement segment in one of the following ways:

- Priority 1: Based on the segment value assignment maintained in Customizing for [Define Segment Value for Automatic Determination](#) under [Logistics – General > Segmentation](#).
- Priority 2: If you do not specify the segment value assignment in Customizing activity [Define Segment Value for Automatic Determination](#), the system determines the requirement segment based on the default stock segment you define in Customizing for [Define Segmentation Structures](#) under [Logistics – General > Segmentation](#).
- Priority 3: If BLANK is not a valid segmentation value and no segmentation value is found, the system displays an error message.

Scenario 3: DC2 supplies to DC1. The supplying plant is not relevant for segmentation. You define the stock segment in the stock transport order. As the supplying plant is not relevant for segmentation, the system does not determine the requirement segment and the material is posted.

The following image illustrates the transfer of stock between plants with different segmentation strategies:

Scope = Both Requirement and Stock Segment Maintained

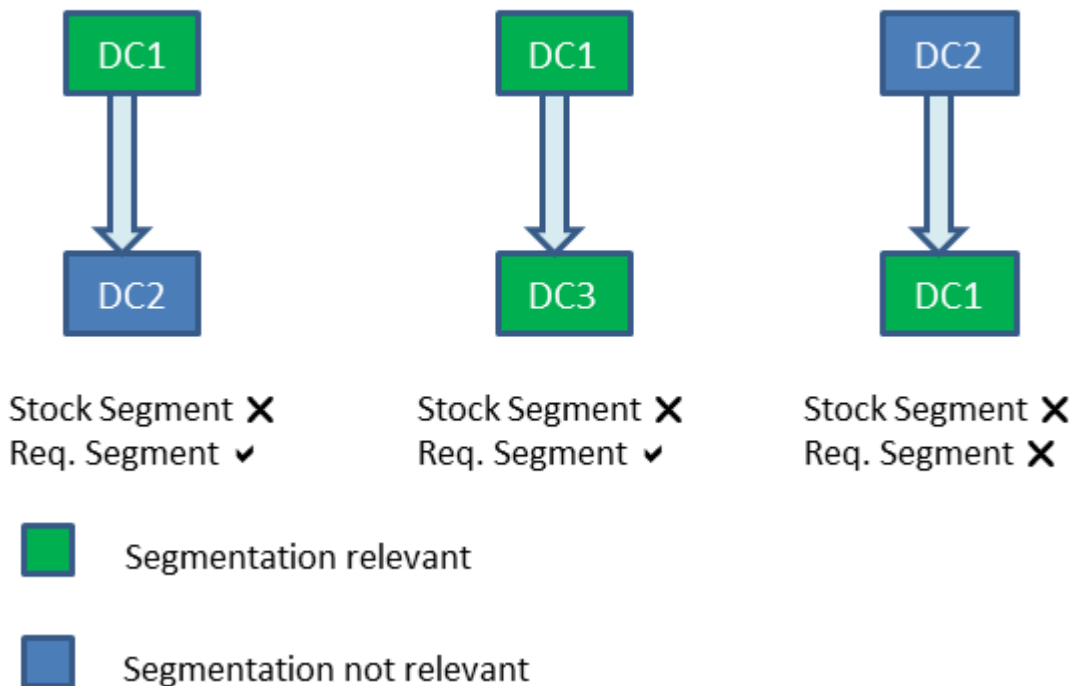

Scope is maintained as Only Requirement Segment is Maintained in the segmentation strategy

Scenario 4: DC3 supplies to DC1. Both the supplying plant and the receiving plant are relevant for segmentation. However, as the scope is **Only Requirement Segment is Maintained** in the segmentation strategy, you do not define the stock segment. The system determines the requirement segment based on the segment value assignment you define in Customizing for **Define Segment Value for Automatic Determination** under **Logistics – General > Segmentation**.

The following image illustrates the transfer of stock between plants with different segmentation strategies:

Scope = Only Requirement Segment Maintained

Mass Maintenance of Materials with Segmentation

Use

You can use mass maintenance for changing large volumes of data in a number of different purchasing documents, in a single step. You can change header data, and item data such as the plant or the terms of payment.

Prerequisites

- You have activated the business function LOG_SEGMENTATION
- You have created materials and assigned a segmentation strategy to the materials in the material master

Features

If you have activated the business function LOG_SEGMENTATION and have assigned a segmentation strategy to your materials, you can use mass maintenance function to change the stock segment in the following documents in a single step:

- Purchase order
- Stock transport order
- Contracts
- Purchase requisitions
- Stock transport requisitions
- Purchasing info record

The system validates the segmentation value when you save the document, based on the segmentation strategy assigned to the material.

Weights and Volumes in Purchasing Documents

Use

Weights and volumes is an additional data you can maintain for different stock segments of a material.

Features

You can view the valid weights and volumes for different stock segments in the detail view of the material. The system displays the weights and volumes based on the values maintained in the material master under additional data.

When you create a delivery, the weights and volumes for the material in the purchase document are transferred accordingly to the batch split item of the delivery document. If you do not maintain the weights and volumes in the material master, the system determines the weights and volumes for the material.

The system displays the weights and volumes for materials in the following purchasing documents:

- Purchase Order
- Contracts

- Inbound Delivery

Batch Management for Material Segmentation

Use

You can define batch management depending on plants and materials in material master. Batch management is supported for the plant and the batch number is determined when you perform a goods issue, outbound delivery, and transfer order. Batch management is mandatory, if the material is relevant for segmentation and the **Scope** is **Only Requirement Segments Maintained** in segmentation strategy.

Features

You have the following options for the internal batch management:

- Standard Batch Numbering
- Discrete Batch Numbering

The batch number is determined when posting the goods receipt, dependent on which batch indicator is set in material master.

For materials with segmentation, the batch management is at plant level only. Thus the batch number is

- unique in connection with a plant and a material
- only known in the plant in which it was created
- not known in other plants in which the material also exists

During a stock transfer to another plant, the batch is not known in the receiving plant and the system does not transfer any data. The system determines the batch in the receiving plant according to the batch management selected there.

Standard Batch Numbering

Use

The standard internal batch numbering procedure for materials with segmentation, assigns one batch number for each combination of material, plant, and stock segment during goods movement. The system will use the same batch number for all goods movements of the same combination of material, plant, and stock segment.

Example

Assume a material with different stock segments X, Y, and Z. At the goods receipt of the corresponding stock segments, the batch numbers are assigned as follows: 001 for X, 002 for Y and 003 for Z. If the stock segment Z already exists in the system with the batch number 023, it is posted to the already existing batch 023, and not assigned to the new batch 003.

Discrete Batch Numbering

Use

The discrete batch numbering enables you to trace individual batches in the system, since a separate batch number is issued for each received quantity of a material with stock segmentation. Discrete batch numbering is available only for the materials with segmentation and if the materials are managed in batches. The system assigns an internal batch number to each item of a goods receipt that is posted. Each received quantity of a material with segmentation will then have an individual batch number, without reusing batch numbers for already existing stock segment.

Prerequisites

If you want to activate discrete batch numbering, choose the **Disc. batch num** option in material master.

Example

Assume a material with different stock segments X, Y, and Z. At the goods receipt of the corresponding stock segments, the batch numbers are assigned as follows: 001 for X, 002 for Y and 003 for Z.

Split Valuation of Materials in Purchasing Documents

Use

You can use materials that you enable for split valuation in as many different partial stocks as you want. The system uses the split valuation type to apply a split valuation to a partial stock. The partial stocks refer to the batches or stock segments of materials with segmentation. The system updates the total stock, in addition to the partial stock. The value calculation of the total stock results from the total of inventory value and inventory quantity of the individual pieces of partial stock (moving average price).

Integration

The system determines the valuation type for different stock segments of the material in the following purchasing and inventory documents:

- Purchase order
- Goods issue
- Goods receipt
- Inbound delivery
- Invoice verification
- Batch management

Prerequisites

- You have assigned and fixed a segmentation strategy for a material in the material master
- You have assigned a valid split valuation type by choosing valuation type X for **Automat. (Batch)** in **Logistics DC: 1 > Accounting** view of the material in the material master
- You have created characteristics that are relevant for segmentation (Material Valuation (VAL) using the transaction CT04) and used these characteristics as segment values

Features

You create batches for different stock segments of a material using the transaction MSC1N. When you create batches in this way, the system uses the stock segment to determine the valuation type. After creating a batch, you cannot change the valuation type in the transaction MSC2N. If you create a batch (when you perform the first goods receipt), the system updates the valuation type to the batch master record of the relevant stock segment and defines the valuation of the batch.

In these purchasing and inventory documents, the system uses the stock segment you enter to determine the valuation type. To reapply a valuation type for the batches, you must run the report SGT_MSC2.

If the material is relevant for segmentation and the accounting view is not generated, the system does not determine the valuation type.

Viewing Stock Overview of Materials with Segmentation

Use

You can display the stock overview of a material with segmentation in a tree structure. The system displays the nodes in the tree structure in the following sequence:

Plant > Storage Location > Stock Segment > Batch

The system displays the stock quantity for individual batch number.

Procedure

1. Goto transaction RWBE.
2. In the **Stock Overview** screen, enter the material.
3. Choose the **List Display** tab.
4. In the **List as** section, choose **Tree Structure**.

In the **Display Levels** section, the system selects **Base Plant Group**, **Plant**, and **Storage Location** by default.

5. To view the stock of a material at the stock segment level, you must select the **Batch** option.

You can only view the stock overview for the storage location of a material. If you do not select the **Batch** option. If you do not select **Storage Location** and you only select the **Batch** option, the **Storage Location** option and the plant details are automatically selected.

6. Enter the stock segment to filter the stock overview for the article at the stock segment level.

For materials with segmentation, you must use batch management. When you select the **Batch** option, the system automatically selects the **Storage Location** option. The system also displays the stock segment details for the material.

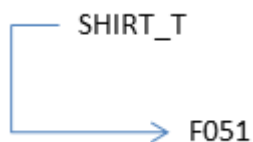

Example

The following table describes the system settings for the material SHIRT_T, of type **Single Article**:

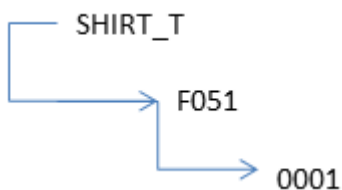

Plant	Storage location	Stock segment	Batch number
F051	0001	LOWRET	00000176

The system can display stock of SHIRT_T in the tree view as follows:

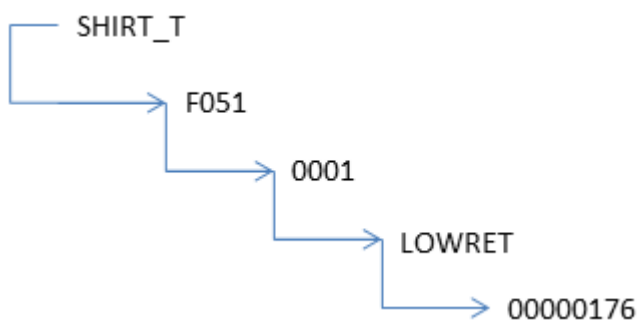

- By default:

- By storage:

- By batch, if the material is managed in batches:

Reporting in Purchasing

Use

Reports are used to access information from the database, and to list the results based on the selection criteria.

Features

If you have activated the business function LOG_SEGMENTATION, the following reports display the segmentation values in the result screen:

Purchase orders

Transaction	Description
ME2L	Purchasing Documents per Vendor
ME2M	Purchasing Documents for Material
ME2K	Purchasing Documents per Account Assignment
ME2J	Purchasing Documents per Projects
ME2C	Purchasing Documents for Material Group
ME2B	Purchasing Documents per Requirement Tracking Number

Transaction	Description
ME2N	Purchasing Documents per Document Number
ME2W	Purchasing Documents per Supplying Plant

Purchase requisitions

Transactions	Description
ME5A	Purchase Requisitions: List Display
ME5K	Requisitions by Account Assignment
ME5J	Purchase Requisitions for Projects
ME5R	Archived Purchase Requisitions

Outline Agreement

Transaction	Description
ME3L	Outline Agreements per Vendor
ME3M	Outline Agreements by Material
ME3K	Outl. Agreements by Acct. Assignment
ME3J	Outline Agreements per Project
ME3C	Outline Agreements by Material Group
ME38	Maintain Sched. Agreement Schedule
ME3N	Outline Agreements by Agreement No.

RFQ/Quotation

Transaction	Description
ME4L	RFQs by Vendor
ME4M	RFQs by Material
ME4S	RFQs by Collective Number
ME4C	RFQs by Material Group
ME4B	RFQs by Requirement Tracking Number
ME4N	RFQs by RFQ Number

More Information

[Reporting in Purchasing](#)

Segmentation based EAN in Purchasing Documents

Use

For materials that are relevant for segmentation, the system uses the stock segment to determine the EAN value in the purchasing documents (such as goods receipt, stock transport order, purchase order).

Prerequisites

- You have activated the business function LOG_SEGMENTATION_03.
- You have created characteristics that are relevant for EAN using transaction CT04.
- You have created the segmentation strategy and the segmentation structure using the characteristics that are relevant for EAN.
- You have created a material and maintained EANs for different segmentation values of Unit of Measure (UoM). You can maintain EAN in the Additional EAN tab of the Additional Data screen in material master.
- You have maintained the Vendor Main EAN for the material.

Features

Purchase Orders

When creating or changing purchase orders, the system determines the Vendor Main EAN according to the stock segment and the Unit of Measure (UoM) of the purchase order item. If you change one of the following values for a purchase order item in the document, the system redetermines the EAN number accordingly:

- Unit of Measure
- Stock segment
- Vendor
- Plant

i Note

You can change the EAN value manually for a purchase order item. The system does not validate the new EAN value along with the segmentation value and allows you to save the document.

Stock Transport Orders

In case of a stock transport order, the system uses the requirement segment to determine the EAN value for the item. The system always determines the main EAN value if you have maintained multiple EAN numbers. When you create an outbound delivery with reference to a stock transport order, the system does not copy the EAN details of the material from the reference document. Instead, the system determines the EAN value according to the stock segment value. If you enter a stock segment for a batch item or change the sales UoM for a batch split item in the batch split screen, the system redetermines the EAN value according to the stock segment. If you change the sales UoM for the generic material in the item overview screen, the system redetermines the EAN value for the material.

i Note

You can change the EAN value manually for a stock transport order item. The system does not validate the new EAN value along with the segmentation value and allows you to save the document.

Inbound Delivery

When you create an inbound delivery with reference to a purchase order, the system copies the EAN details of the material from the reference document. If you enter or change a stock segment for a batch item or change the sales UoM for a batch split item in the batch split screen, the system redetermines the EAN value according to the stock segment. If you change the sales UoM for the material in the item overview screen, the system redetermines the EAN value for the material. You can change the EAN value manually for an item in the inbound delivery. The system does not validate EAN and allows you to save the document.

Goods Receipt

When you create a goods receipt with reference using transaction **MIGO**, the system copies the EAN number from the reference document. You can change the EAN value manually and the system does not validate the new EAN value along with the segmentation value and allows you to save the material document. If you change the stock segmentation value, the system redetermines the EAN number.

When you create a goods receipt using the BAPI, the system performs the following:

- Determines the material and the corresponding segmentation value using the EAN number sent through the BAPI. You must have maintained the segmentation value for the EAN in material master.
- Compare the determined segmentation value with the segmentation value of the batch number provided. If the segmentation values are equal, the system saves the material document and if the values are not equal, the system displays an error message.

More Information

For more information about the master data settings, see [Segmentation based EAN](#) in SAP Help Library.

Determination of Pricing in Purchasing Documents based on Segmentation

Use

The standard condition technique has been enhanced with segmentation-specific pricing. For example, you can create the additional condition records according to the segmentation value needed for the pricing. To do this, you should use segmentation-specific condition types.

Prerequisites

You have activated the business function **LOG_SEGMENTATION_03**.

Features

In addition to the existing standard condition type, condition table, access sequence, and pricing procedure available for the purchasing documents, you can use the following segmentation-specific condition type, condition table, access sequence, and pricing procedure in the purchasing documents. These are standard condition tables delivered by SAP. You can use them appropriately in the existing configurations to enable the segmentation-specific pricing.

Condition Type	PBSG
Condition Table	Vendor/Material/Purch. Organization/Plant/Info record category/Stock segment: A4AG Purch. Organization /material/plant/Info record category /Stock segment: A4AH
Access Sequence	SG02
Pricing Procedure	SM0000

You can only maintain condition records for a segmentation value that is relevant for pricing. When you create characteristics for segmentation using transaction CT04, you need to mark whether the segmentation value is relevant for pricing. When you create purchasing documents, the system determines the pricing according to the segmentation value you have entered in the document. If the segmentation value is not relevant for pricing or you have not maintained the condition records for the corresponding segmentation value entered in the document, the system does not determine the pricing record in the purchasing documents.

i Note

Segmentation-specific pricing is not applicable in purchasing contracts.

Segmentation: Subcontracting

Use

This section describes how to procure materials relevant for segmentation using a Subcontracting Purchase Order. It describes how subcontract orders are processed in **Purchasing and Inventory Management**. By procuring a material that is relevant for segmentation using subcontracting, you provide your vendor with materials needed to produce the finished product you have ordered.

Prerequisites

You have activated the business function LOG_SEGMENTATION_03.

Features

You can procure a material using subcontracting by performing the following steps:

- You can order the finished product with a subcontracting purchase order. You can enter the components required by the vendor for the production of the finished product in the purchase order or derive them automatically from the relevant Bill of Materials (BOM).

- You can provide the required components to the vendor by directly posting a goods issue or by using the outbound delivery. This physical stock is located at your vendor, but remains the property of your company (tracked using **Special Stocks with Vendor**) until the goods receipt of the finished product.
- The vendor provides the service and delivers the ordered material. With the goods receipt of the finished product, the backflush consumption of the components is automatically completed.

[Subcontracting in Purchasing](#)

[Subcontracting in Inventory Management](#)

Master Data

Use

For more information about creating bill of material, see [Bill of Materials](#).

More Information

[Segmentation: Subcontracting](#)

Subcontracting in Purchasing

Use

You can use the subcontracting items (SC items) in purchase requisitions and purchase orders to order material to be produced in subcontracting. If you want to procure materials that are relevant for segmentation using subcontracting, you can manually enter the type and quantity of the components to be provided for the individual segmentation value of the components in the document or if you have already created a BOM for the ordered material, the system automatically copies the relevant data from the BOM.

Features

The standard SAP ERP system supports the procurement of materials relevant for segmentation using subcontracting at the segment level and is available for subcontracting (SC) purchase requisitions and SC orders.

More Information

[Segmentation: Subcontracting](#)

[Creating or Changing Subcontracting Purchase Requisitions or Purchase Orders](#)

Creating or Changing Subcontracting Purchase Requisitions or Purchase Orders

Use

You can start the subcontracting process in purchasing with one of the following:

- A purchase requisition that has been created manually or as a result of MRP
- Purchase order that has been created manually

i Note

In both cases, the purchasing document item should have a specific item category for subcontracting (L).

To create a subcontracting purchase requisition or purchase order manually, perform the following steps:

Procedure

1. Enter the material you want to order and the item category for subcontracting (L) in the order item.
 - If the material is relevant for segmentation, you need to specify the stock segment for the purchasing document item.
2. You can enter the list of components to be provided manually or through BOM explosion.
 - If you have not maintained a BOM for the material, you can enter the components in the [Components Overview](#) screen manually.
 - If you have maintained a BOM for the material, the system automatically explodes the BOM in the [Components Overview](#) screen. You can view the components and/or add/change components and the quantities.
 - If the header material and the components are relevant for segmentation, the system determines the requirement segment for the individual components depending on the mapping defined in the [Dependent Requirements/Stock Transfer](#) table in the Customizing activity [Define Segmentation Strategies](#) under [Logistics - General > Segmentation](#). The stock segment of the header material is used to determine the requirement segment for the components.
 - If the header material is relevant for segmentation and the components are not relevant for segmentation, the system does not determine the requirement segment for the components.
 - If the header material is not relevant for segmentation and the components are relevant for segmentation, the system determines the requirement segment from the relevant BOM.

i Note

The system allows you to change the requirement that is already determined through the BOM or the segmentation strategy. However, you only can enter the valid segmentation value based on the selected segmentation strategy.

More Information

[Subcontracting in Purchasing](#)

Subcontracting in Inventory Management

Use

Inventory Management supports the following functions for the special procurement type subcontracting:

- Provision of components
- Goods receipt of the finished product (with consumption of components)

More Information

[Segmentation: Subcontracting](#)

[Provisioning of Components](#)

[Goods Receipt of the Finished Product](#)

Provisioning of Components

Use

You can initiate the process of provisioning of the components using the [Subcontracting Cockpit](#).

You can provide the components to the subcontractor by directly creating an outbound delivery or by posting the goods issue. When you provide the components, you transfer post the materials from the unrestricted-use stock to the 'special stock at vendor (subcontracting stock)'.

When you create an outbound delivery or post the goods issue, the system allows you enter a batch number according to the segmentation value defined in the segmentation strategy assigned for the material. The system displays an error message if the batch number does not match the requirement segment. Alternatively, the system can use the batch determination process to determine the batch according to the stock segment.

More Information

[Subcontracting in Inventory Management](#)

Goods Receipt of the Finished Product

Use

After manufacturing the product, the subcontractor delivers the finished product. You can receive the finished product by creating an inbound delivery or directly posting the goods receipt for the subcontracting purchase order.

When you receive the goods, the unrestricted-use stock of the finished product increases in the receiving site and stock of the component materials decreases at the special stock at vendor.
