Sales and Distribution

Sales allows the realization of different business transactions based on sales documents stored in the system. When creating a sales order, you can carry out an availability check to determine whether the desired materials are in stock. This also checks whether the stock is sufficient to fill the order by the desired delivery date. A confirmed delivery date is determined based on the results of the availability check. The material requirements planning (MRP) assigns the requirement quantities to the available stock, or creates procurement proposals. For stock that is not available the internal or external procurement (purchase requests or planned orders) are created.

Segmentation in Sales Documents

Use

Segmentation is available in sales and distribution (SD). Segmentation at the item level allows you to you to sell materials with different attributes, for example, quality of the material and its country of origin. To sell materials with segmentation, you can provide data in sales documents using requirement segments.

For more information about processing sales documents in the standard ERP system, see [Sales \(SD-SLS\)](#).

Prerequisites

You have made the following settings:

- Segmentation structure and segmentation strategy are maintained in the Customizing for [Segmentation](#) under  [SAP Implementation Guide](#)  [Logistics - General](#) 
- The material is made segmentation relevant in material master
- Fix segmentation has been chosen for the corresponding distribution center (DC)

Features

To sell materials with segmentation, the system allows you to maintain data in sales documents for the corresponding requirement segment. You can maintain requirement segment in sales document in one of the following ways:

- manually enter requirement segment
- copy requirement segment from preceding document
- default determination of requirement segment based on the default value maintained for the characteristic maintained for the application area, in this case, sales order is the application area

For detailed information about how segmentation is handled in individual sales documents, see the following:

- [Segmentation: Sales Orders, Inquiries, Quotations, and Contracts](#)
- [Segmentation: Delivery and Billing](#)

More Information

[Creation of a Sales Document with Reference](#)

Segmentation: Sales Orders, Inquiries, Quotations, and Contracts

Use

Segmentation is available in sales and distribution (SD). Segmentation at the item level allows you to you to sell materials with different attributes, for example, quality of the material and its country of origin. To sell materials with segmentation, you can provide data in sales documents using requirement segments.

Prerequisites

You have maintained the following settings in Customizing under ► [SAP Implementation Guide](#) ► [Logistics - General](#) ► [Segmentation](#) ►:

- segmentation structure
- segmentation strategy

Features

For sales documents such as sales order, inquiry, quotation and contract, you can carry out the following functions:

- specify requirement segment for a material
- change requirement segment for a material

i Note

You can maintain blank as the segmentation value to be used in combination with a segmentation strategy. In such cases, materials will have blank as segmentation value in sales documents.

More Information

- [Segmentation Structure](#)
- [Segmentation Strategy](#)

Segmentation: Delivery and Billing

Use

Segmentation is available in sales and distribution (SD). Segmentation at the item level allows you to you to sell materials with different attributes, for example, quality of the material and its country of origin. To sell materials with segmentation, you can provide data in sales documents using requirement segments and stock segments.

Prerequisites

You have maintained the following settings in Customizing under ► **SAP Implementation Guide** ► **Logistics - General** ► **Segmentation** ►:

- segmentation structure
- segmentation strategy
- requirement segment for the sales document

Features

For delivery, you can carry out the following functions based on the type of delivery:

- Outbound delivery with reference

Requirement segment will be adopted from the preceding sales document and stock segment will be adopted from the batch.

- Outbound delivery without reference

You specify the requirement segment and stock segment will be adopted from the batch. There is incompleteness log for this type of deliveries and this will be triggered like sales order when you save segmentation relevant article without specifying requirement segment values.

For billing, requirement segments and stock segments are adopted from preceding sales documents.

i Note

You can maintain blank as the segmentation value to be used in combination with a segmentation strategy. In such cases, materials will have blank as segmentation value in sales documents.

More Information

Batch Determination for Outbound Deliveries

Use

You can activate automatic batch determination for delivery item categories using the Customizing activity **Activate Automatic Batch Determination in SD** under ► **Logistics - General** ► **Batch Management** ► **Batch Determination and Batch Check** ►. For such delivery items, batch determination is triggered automatically in outbound deliveries. A batch split describes the situation when more than one batch is used to cover a particular delivery item. The batch split function in the delivery includes a batch selection screen and an availability check.

Prerequisites

You have defined the necessary settings in the Customizing activities under ► **Logistics - General** ► **Batch Management** ►.

Features

Segmentation is now integrated in the batch determination process. If you use materials that are not relevant for segmentation, the batch is determined in the same way as in the batch determination process in standard SAP ERP.

Scenario 1

If you create an outbound delivery with reference to a sales order, a stock transfer order, a return purchase, or without any reference, the batch is determined as follows:

Automatic Batch Determination is OFF

If you have not activated automatic batch determination, you can enter the batch number in the delivery documents manually. You can only enter the batches that belong to the valid stock segment value that is maintained in the mapping rule in the [Requirement/Stock Allocation](#) table in the Customizing activity [Define Segmentation Strategy](#).

Automatic Batch Determination is ON

For a material relevant for segmentation, The system filters the batch numbers according to the segmentation value and proposes a suitable batch number(s) with batch split.

i Note

For the requirement segment provided in the reference document, the corresponding stock segment is determined using the mapping rule defined in the [Requirement/Stock Allocation](#) table in the Customizing activity [Define Segmentation Strategy](#) under [Logistics - General > Segmentation](#). Then, the batch is determined based on the stock segment.

Scenario 2

If you create an outbound delivery with reference to a return sales order or return stock transfer order, the batch is determined in the same way as the determination process described in scenario 1 with the following differences:

- If the system cannot determine a batch in the standard batch determination process, you can manually enter a new batch number that is not yet available in the system.
- For a material relevant for segmentation, the system proposes the first entry of the segmentation value in the mapping rule defined in the [Requirement/Stock Allocation](#) table in the segmentation strategy. A new batch is created for the proposed stock segmentation. If the mapping rule is not maintained in customizing, the system cannot create the batch.

Creation of a Sales Document with Reference

Use

You can use the requirement segment of an existing sales document as the basis for a new sales document by making use of [Create with Reference](#).

The requirement segment of the source document is copied to the target sales document.

Prerequisites

The source sales document was created with requirement segment.

Features

- You can copy requirement segment from one sales document type to a new sales document by making use of [Create with Reference](#).
- You can then modify the requirement segment of the new sales document (target). For example, if you have copied a requirement segment from an inquiry to a quotation, you can later on change the requirement segment of the quotation but not that of the inquiry.
- If the source sales document type is the same as the target sales document type, then the requirement segment can be modified in both the source or target sales document. For example, if you have copied a requirement segment from one quotation to another quotation, you can later on change the requirement segment of both the quotations.

Incompletion Log

Use

If you try to save a sales document without having maintained the requirement segment for segmentation relevant material, then the system displays the incompletion log for the sales document. The incomplete sales documents can be saved in the system.

i Note

Sales documents can be created for materials without segmentation strategy. No incompletion log is created for such sales documents.

If the requirement segment is blank and valid, no incompletion log will be generated.

Activities

- All sales documents with incomplete data, except delivery documents created with reference and billing documents, are stored in the incompletion log.
- From the incompletion log, you maintain requirement segment for the corresponding material.

Special Business Processes in Sales

In addition to carrying out routine sales order processing in the [SAP Sales & Distribution](#) module, you can also implement more specialized business processes, such as the processing of third-party business transactions, purchase-to-order transactions, and consignment processing.

For more information about special business processes in the standard sales processes, see [Special Business Processes in Sales](#).

Segmentation in Special Business Processes

Use

You can use materials with segmentation while executing specialized business processes if the business function LOG_SEGMENTATION is activated.

Process

Consignment Processing

When you process the consignment stock, if you use materials that are relevant for segmentation, segment values are considered during order creation and the orders are saved with the segmentation values.

Third-Party Order (TPO) Processing

In third-party order processing, a purchase requisition is created for each order item. For the requirement segment in the sales order the matching stock segment in purchase requisition is determined based on segmentation strategy defined in Customizing for ► [Logistics – General](#) ► [Segmentation](#) ► [Define Segmentation Strategies](#) ► [Requirement to stock conversion](#) ►.

Reporting in Sales

Use

Reports are used to access information from the database, and to list the results based on the selection criteria.

Features

If you have activated the business function LOG_SEGMENTATION, the following reports also display the segmentation values in the result screen:

Sales Documents

Transaction	Description
VA05	List of Sales Orders
VA15	List of Inquiries
VA25	List of Quotations
VA45	List of Contracts
VF05	List of Billing Documents

More Information

For more information about reporting in sales, see [Reports and Analyses \(SD - IS - RE\)](#) in [SAP Library](#) for [SAP ERP Central Component](#) on [SAP Help Portal](#).

Segmentation based EAN in Sales Documents

Use

For materials that are relevant for segmentation, the system uses the requirement segment to determine the EAN number in the sales documents such as sales order and contracts.

Prerequisites

- You have activated the business function LOG_SEGMENTATION_03.
- You have created characteristics that are relevant for EAN using transaction CT04.
- You have created the segmentation strategy and the segmentation structure using the characteristics that are relevant for EAN.
- You have created the material and maintained EANs for different segmentation values of Unit of Measure (UoM). You can maintain EAN in the Additional EAN tab of the **Additional Data** screen in the material master.

Features

Sales orders

When creating or changing sales orders, the system determines the EAN number for the combination of material, Unit of Measure (UoM), and requirement segment. If there are multiple EAN numbers, the system selects the main EAN entry you maintained for the material. If you change one of the following values for a sales order item in the document, the system redetermines the EAN number accordingly.

- Unit of Measure
- Requirement segment
- Plant

i Note

You cannot change the EAN number manually in a sales document.

Material determination enables the automatic substitution of materials in sales documents during sales order processing. In addition, you can use material determination if you want the system to substitute the EAN numbers with your own material numbers automatically.

You can enable material determination by making the following settings:

- Maintain the material determination master record using transaction VBxx
- Assign the material determination procedure to the document type in the customizing activity **Assign Procedures To Sales Document Types** under **►Sales and Distribution ► Basic Functions ► Material Determination (transaction OV14) ►**.

If you maintained a substitute material in transaction VBxx, the system determines a substitute material for the material you enter during sales order creation. The system also displays the substitution reason in the document.

When you enter the EAN number instead of the material in the document, the system determines the material for the EAN number maintained in the transaction VBxx. In addition, the system determines the segmentation value of the material for the EAN number if maintained in the material master.

When you enter both EAN number and segmentation value in the document, the system performs the following:

- Determines the material for the EAN value maintained in transaction VBxx.
- Accepts the segmentation value you entered and saves the document if the segmentation characteristics are not relevant for EAN.

- Determines the segmentation value for the EAN value and compares with the segmentation value you entered if the segmentation characteristics are relevant for EAN. If the segmentation values are the same, the system saves the document. If the segmentation values are different, the system does not allow you to save the document and displays an error message.

i Note

The system follows the similar process when you use BAPI or IDoc.

Outbound Delivery

When you create an outbound delivery for segmentation relevant materials with reference to a sales order, the system does not copy the EAN details of the material from the reference document. Instead, the system determines the EAN value according to the stock segment. If you enter the stock segment for a batch item or change the UoM for a batch split item in the batch split screen, the system redetermines the EAN value according to the updated stock segment. When you create an outbound delivery for the segmentation relevant materials without a reference, the system determines the EAN value according to the stock segment.

More Information

For more information about the master data settings, see [Segmentation based EAN](#) in SAP Help Library.

Determination of Pricing in Sales Documents based on Segmentation

Use

The standard condition technique has been enhanced with the segmentation-specific pricing. For example, you can create the additional condition records according to the segmentation value needed for the pricing. To do this, you should use the segmentation-specific condition types.

Prerequisites

You have activated the business function LOG_SEGMENTATION_03.

Features

In addition to the existing standard condition type, condition table, access sequence, and pricing procedure available for the sales documents, you can use the following segmentation-specific condition type, condition table, access sequence, and pricing procedure in the sales documents. These are standard condition tables delivered by SAP. You can use them appropriately in the existing configurations to enable the segmentation-specific pricing.

Condition Type	PRSG
Condition Table	Sales org./Distribution channel/Customer/Material/Requirement segment: A4AE Sales org./Distribution channel/Customer/Material/Stock segment: A4AF
Access Sequence	PRSG

Pricing Procedure	SVAA01
-------------------	--------

You can only maintain condition records for a segmentation value that is relevant for pricing. When you create characteristics for segmentation using transaction CT04, you need to mark whether the segmentation value is relevant for pricing. When you create sales documents, the system determines the pricing according to the segmentation value you have entered in the document. If the segmentation value is not relevant for pricing or you have not maintained the condition records for the corresponding segmentation value entered in the document, the system does not determine the pricing record in the sales documents.
